1. The International Authority Exposure Dataset

Recent large-scale data collection efforts have brought important advances by enabling researchers to systematically measure and compare levels, characteristics, and trajectories of authority among international organisations (IOs) over time. However, because such data are measured at the level of IOs, researchers could not use these sources to study the sources and consequences of member state exposure to such IO authority. To enable systematic comparative research in this direction, we build on these advances to generate and present in this codebook the *International Authority Exposure Dataset*.

The *International Authority Exposure Dataset* combines authority data from both the Measure of International Authority (MIA) (Hooghe *et al.*, 2017; Hooghe, Lenz and Marks, 2019) and the International Authority Database (IAD) (Zürn, Tokhi and Binder, 2021) with IO membership data from the Correlates of War (COW) 3.0 project (Pevehouse *et al.*, 2020) to estimate ***countries' exposure to IO authority at the country-year level for 213 countries in the period from 1950-2019***. To that end, we harmonised, merged, manually extended and processed the original data sources. We publish the final dataset alongside the STATA code needed to replicate it from the original data sources alongside this codebook.

This codebook provides information on how the source datasets were harmonised, merged and processed to generate a common set of final variables. We start by shortly explaining each of the original dataset structures and key contents and then elaborate on how we processed each dataset to arrive at the final authority exposure measures. The last section provides an overview of the sample(s) and variables in the final dataset.

2. Data Structures

The final variables of a state's international authority exposure between 1950 and 2019 are generated from three distinct data sources. We shortly describe their structure below.

2.1. Data structure of MIA

The unit of analysis in the MIA dataset (Hooghe *et al.*, 2017; Hooghe, Lenz and Marks, 2019) is the individual international governmental organization (IO), measured at the IO-year level. MIA codes a sample of 76 IOs from 1950-2019.

MIA measures international authority, meaning political authority in the international domain. Political authority for the MIA dataset is defined as “the power to make collective decisions based on a recognized obligation to obey.” It conceives of authority as either emerging through delegation, the conditional grant of authority by member state to an independent body, or through pooling, that is the joint exercise of authority by member states. Each IO is manually coded following a model that evaluates authority of IO bodies across decision stages and decision areas, aggregated into ***final scores for delegation, pooling, and dispute settlement as authority dimensions***, all ranging from 0 to 1. (For a detailed description of the dataset, see the [MIA codebook](#))

Additionally, MIA provides a separate dataset which measures an IO's policy portfolio between 1950 and 2017, again at the IO-year level. As well as recording the specific mandated policy fields of an IO-year, the dataset distinguishes between (the number of) ‘core’ and ‘flanking’ polices.

2.2. Data structure of IAD

The unit of analysis in the IAD dataset (Zürn, Tokhi and Binder, 2021) is again the individual international governmental organization (IO) at the IO-year level. IAD codes a sample of 34 IOs from 1919-2013.

IAD measures IO authority by focusing on how IOs exercise authority over states when designing and implementing policies. Using a concept of authority that conceives of it as the autonomy and bindingness of an IO's decision making, the data contains information on both an IO's political authority (authority to take decisions) as well as its epistemic authority (the authority to make recommendations). These measures are estimated based on coding of how IOs exercise authority across the policy cycle (agenda setting, rulemaking, monitoring, norm interpretation, enforcement, knowledge generation, and evaluation). These function-level authority scores are aggregated into a *final authority score*, both as a raw sum and normalised to range between 0 and 1. (see the [IAD codebook](#) for details on the coding and dataset).

2.3. Data structure of COW

The Correlates of War 3.0 International Governmental Organizations (IGOs) Dataset contains annual information on the country membership of IGOs. The unit of analysis (in this version) of the COW data is the IO-year with each state's (non-) membership as a variable. Hence each observation equals a vector of the respective IO and whether the included country was a member. The data covers the time period from 1816-2014.

Membership is categorized into 6 categories: No membership = 0, Full Membership = 1, Associate Membership = 2, Observer = 3, Missing data = -9, State Not System Member = -1.

3. Merging Process

To combine the MIA, IAD, and COW membership data, each dataset needed to be prepared and harmonised. This section provides an overview over the necessary changes. These changes can also be found in the footnotes of Table 2 comparing each of the datasets.

3.1. Preparation MIA

IO Authority data:

No changes needed, except for the ones in the footnotes of Table 2.

IO Policy data:

MIA policy scores were merged (after very few changes) with the main MIA dataset. Only a few corrections of small mistakes needed to be done:

List of changes:

- IO number for LAIA/ALADI changed to consistently be 3430
- IO number for WTO changed to consistently be 4580
- Expansion of data to 2019, by extending the last observation forward from 2017

3.2. Preparation IAD

List of changes:

- Extend dataset from 2013 to 2019 by carrying the last authority observation forward

3.3. Preparation COW

The COW dataset had to be transposed from wide to long format and the membership data had to be updated so that it includes each IOs membership up until 2019. This yields a dataset at the IO-country-year level, enabling us to later generate exposure variables at the country-year level.

Since we wanted to combine Authority data with COW's membership data, we only updated the membership on the IOs that were included in the MIA data. That left us with 76 IOs that were checked for new member states in the five years leading up to (and including) 2019.

Table 1 provides an overview over the IOs that had membership changes, based on the original coding of the COW dataset. If an IO is not named in that table, its membership did not change in the years between 2014 and 2019.

List of changes:

- An EU variable that goes back to 1958 needed to be generated¹
- The EAC variable needed to be extended back from 1995 to 1993²
- A united German variable needed to be generated combining (historical) West- and East Germany³
- EEA membership updated relative to EU membership based on official EU sources⁴
- Transpose from COW from wide to long format using IO number and year as the ID variable alongside country

¹ COW does not include an extensive observation (from 1958) for the EU, but different observations for the European Economic Community (EEC) and European Coal and Steel Community (ECSC). We therefore generated an EU variable that has the data of the EEC before 1993 and the ECSC for before 1958.

² This is the official start date according to MIA.

³ We use the data for West Germany before reunification in a common variable for Germany throughout the sample period.

⁴ EEA is not included as such in the COW data. It was therefore generated by duplicating the observations for the EU, and changing the memberships by hand (see Appendix 2)

Table 1 *Correlates of War 3.0 Dataset – Manual update for the years 2014-2021*

4. Merging and Final Variable Generation

Using the above datasets and adjustments, we then first merged the datasets into one IO-year dataset. When discrepancies between the different start or end dates of the respective IOs between MIA and COW occurred, we double checked and (in all cases) went with the COW start date since it usually uses the start date of when the IO came into force.

Nevertheless, this means that some of the IOs have missing data on one of the variables in which the year coverage differed. E.g. Caricom in IAD only starts in 1973 but in MIA in 1965 and in COW in 1970. Therefore, Caricom does not have values on the IAD authority score before 1973, even though it is included in our data from 1970 on.

4.1. IO-Year Sample Overview

This section presents the composition of the final sample and the differences between the three source datasets. Table 2 gives an overview over the IO numbers, the start and end dates of each IO and of each dataset.

Table 2 *Sample Comparison*

IO acronym	IO number	IAD	MIA	COW	International Authority Exposure Dataset
ALADI	3430	missing	1961—2019	1980-2014	1980-2019

WTO	4580 ¹²	1994-2013	1995—2019	1995 - 2014	1995—2019

⁹ Originally a different code in IAD data (2570) which is the ICNWAF, was changed to 2572 (COW)

¹⁰ Has a separate predecessor in COW (SADCC (4251)) between 1980-92. We merged both into one.

¹¹ Different code in MIA (5550), in COW as 4115 and was changed accordingly.

¹² In MIA, GATT and WTO are not distinguished, thus having the same IO number, whereas in COW both have two distinct IDs. We changed the latter, so that only the WTO name & code is used from its GATT origins on.

4.2. Generating Authority Exposure Variables at Country-Year Level

To generate the authority exposure variables, we then simply summed the level of authority of each IO a state is member of in a given year (using either the already aggregated WZB indicator or the sum of the MIA's dimensions-of-authority indicators).

Depending on the application purpose, authority scores can also be combined (e.g. by multiplication) with the policy scope of the IO before generating the exposure variable.

To render these exposure variables more meaningfully comparable across the sample, we then panel-standardise them so that they range from 0-1 with 0 representing the lowest observed level of IO authority exposure in the full sample, and 1 being the highest observed level.

4.3. Final Variables in International Authority Exposure Dataset

Table 3 lists the final variables included in the International Authority Exposure Dataset.

Depending on users' needs, this list can easily be expanded to include additional (more granular) information from the source datasets by tweaking the final commands of the accompanying do-file to (not) delete (some of) the original source dataset variables.

Table 3 *List of final variables in Dataset*

Variable name/label	Meaning/Coding
ID Variables	
Year	Calendar year
Country	Abbreviated state name
Ccode	COW country code
ioname	IO acronym as used in research and IO's public relations
ionumber	Numeric IO code based on COW
orgname	Official name of the IO
IO-YEAR LEVEL VARIABLES	
delegation	Delegation aggregated, 0-1 (MIA)
pooling	Pooling aggregated, 0-1 (MIA)
DS_sum_st	Delegation to dispute settlement, 0-1 (MIA)
Core	number of topics as core topics (MIA)
Flank	number of topics as flank topics (MIA)
ScopeMIA	core + flank (MIA Policy)
Authority	Sum of the function-level authority scores, 0-4.94 (WZB)
ScopeWZB	Sum of IO policy fields, 0-25 (WZB)
COUNTRY-YEAR LEVEL VARIABLES	
member	IO Membership as coded in the COW dataset
Exposure to International Authority incl. Scope (MIA)	Annual sum of exposure to (IO authority x IO scope) (MIA)
Exposure to International Authority incl. Scope (WZB)	Annual sum of exposure to (IO authority x IO scope) (WZB)
Exposure to International Authority (MIA)	Annual sum of exposure to IO authority (MIA)
Exposure to International Authority (WZB)	Annual sum of exposure to IO authority (WZB)

6. Appendix

Appendix 1 *List of not included variables from source datasets*

Variable Name	Label		
dead	those organizations that simply cease operations receive a "1" in the year in which termination occurs (COW)	poolcompliance	financial compliance pooling (0-1)
replaced	Each IO thtas has terminated via one of three processes is coded as "1" (COW)	poolpolicy	policy making pooling (weighted,0-1)
longorgname	A longer version of the IOs name (including previous names)	poolagenda	pooling agenda setting, 0-1
igocode		poolfinal	pooling final decision, 0-1
version	COW version number (COW)	coverage1	is DS obligatory?
imputed	An indicator variable that is coded as "1" when the pre-1965 observation was imputed.	thirdparty1	is there an explicit right to third-party review?
political		tribunal1	how is the tribunal composed?
social		binding1	is adjudication binding?
economic		nonstate1	do non-state actors have legal standing?
acronym	acronym	remedy1	is there a remedy for non-compliance?
inception	Creation of IO (MIA)	preliminary1	is there a preliminary ruling system?
initial	First year in dataset (MIA)	coverage2	coverage2
end	Final year in dataset (MIA)	thirdparty2	thirdparty2
delaccess	delegation on accession (A,F,DS)	tribunal2	tribunal2
delsuspens	delegation on suspension (A,F,DS)	binding2	binding2
delconstit	delegation on constitution (A,F,DS)	nonstate2	nonstate2
delbudget	delegation on budget (A,F,DS)	remedy2	remedy2
delcompliance	delegation on fin compliance (A,F,DS)	preliminary2	preliminary2
delpolicy	delegation on policy (A,F,DS)	DS_sum1	Dispute settlement mechanism 1 (0-7)
del_agenda	delegation on agenda setting (0-1)	DS_sum2	Dispute settlement mechanism 2 (0-7)
del_final	delegation on final decision (0-1)	DS_sum3	Dispute settlement mechanism 3 (0-7)
poolaccess	accession pooling (weighted, 0-1)	coverage3	coverage3
poolsuspens	suspension pooling (0-1)	thirdparty3	thirdparty3
poolconstit	constitutional pooling (weighted, 0-1)	tribunal3	tribunal3
poolbudget	budgetary (0-1)	binding3	binding3
		nonstate3	nonstate3
		remedy3	remedy3
		preliminary3	preliminary3

agricult	Agriculture	humanita	Humanitarian aid (natural or man-made disasters)
competit	Competition policy, mergers, state aid, antitrust	humanrig	Human rights: social, labor rights, democracy, rule of law, non-discriminat
culturea	Culture and media	industri	Industrial policy (includemanufacturing, SMEs, tourism)
educatio	Education (primary, secondary, tertiary), vocational training, youth	justiceh	Justice, home affairs, interior security, police, anti-terrorism
developm	Development, aid to poor countries	migratio	Migration, immigration, asylum, refugees
currency_bank~g	Financial regulation, banking regulation, monetary affairs, currency	military	Military cooperation, defense, military security, peacekeeping
welfares	Welfare state services, employment policy, social affairs, pension systems	regionalpolicy	Regional policy, regional development, poverty reduction
energyco	Energy (coal, oil, nuclear, wind, solar)	research	Research policy
environm	Environment: pollution, natural habitat, endangered species	macroecontaxa~n	Taxation, macro-economic, fiscal coordination
finan_stabil_~g	Financial stabilization, lending to countries in difficulty	telecomm	Telecommunications, internet, postal services
foreignp	Foreign policy, diplomacy, political cooperation	tradecus	Trade, customs, tariffs
fisherie	Fisheries and maritime affairs	transpor	Transport: railways, air traffic, shipping, roads
healthpu	Health: public health, food safety, nutrition	datacoll	Data collection, studies, reports, statistics
		AH	ioname

Appendix 2 *EEA membership recoding*

Member:

Norway and Iceland as members for the whole time
Austria in 1994
Finland in 1994
Sweden in 1994

Non-Member:

Bulgaria before 2011
Croatia before 2014
Cyprus before 2005
Czech Republic before 2005
Estonia before 2005
Hungary before 2005
Latvia before 2005
Lithuania before 2005
Malta before 2005
Romania before 2011
Slovakia before 2005
Slovenia 2005
